COLLECTIVE IMPACT REPORT SERIES

The Evidence We Already Have

A prototype foundation report

What 31 completed program cycles can prove about community-based rehabilitation in California prisons — and what they cannot.

Table 1. Headline measures, defensible subset, 31 cycles

Measure	Value
Defensible cycles	**31**
Cycle enrolments	**1,261**
Completions	**739**
Completion rate	**58.6%**

Source: *data/tpw-collective-impact.csv*, defensible subset (31 cycles). Measured

Report number	TPW-CIR-2026-01
Date	October 2026
Prepared by	Transformative Programming Works
Prepared for	The RIGHT Grant 4.0 policy window
Data	TPW Collective Impact sheet, June 2026 pull
Basis	31 defensible cycles, 2 organizations
Status	Prototype edition, not for external publication

Transformative Programming Works · California nonprofit · 501(c)(3) · EIN 99-2553658

Contents

Four classes of number

Measured
Computed from the 31-cycle defensible subset of the Collective Impact sheet. Reproducible from the CSV by build.py.

Derived · bound
Arithmetic whose true value the sheet cannot see. Computed under one stated convention, so it is reported as a maximum or a minimum and never as a measurement.

Published
A TPW public claim, quoted verbatim. Not verified in this repository, and not usable as evidence of program effect.

Modelled
Arithmetic performed on published claims. Labelled at the point of use. It is an illustration of a claim, never a finding.

One exclusion worth naming

The second-highest completion rate in the file — 25 of 28, or 89.3% — belongs to the row marked **SAMPLE DATA**. The highest is 94.3% (CTF, the 04/01/2025–05/28/2026 cycle, 33 of 35). The sample row is a worked example, not a program. It is excluded from every figure in this report.

Scope

One artefact: the TPW Collective Impact data sheet as submitted for the June 2026 pull. The report asks what that sheet can prove today, what it cannot, and what it would take to close the gap between the two.

Sources

The Collective Impact CSV (13 fields, 104 lines) · the TPW Data Glossary and Submission Instructions, June 2026 · the CDCR RIGHT Grant 4.0 RFA · the 31-facility constants tab · TPW's published site copy.

Method

A cycle is defensible if its status is Completed, its course hours, participants and completions all parse as integers, and it is not the sample row. That leaves 31 of 104 lines. Sums never interpolate a missing value.

How to read this report

Findings · p. 3. The five claims the sheet can and cannot support, in the order the evidence arrives.

Evidence · pp. 4–10. The ask, the money, the map, the instrument, the measured core, completion and the hours floor.

Limits · pp. 11–14. The defect ledger, the missing key, one model, and the chain from 1,261 starts to no observations.

Moves · pp. 15–16. Seven recommendations, sequenced against the §11 dates, and the sources.

Executive summary

The sector can already count activity. It cannot yet count change.

This is the first collective impact report built from TPW's own submission sheet. It is deliberately narrow: it reports only what the sheet can carry, names every number it cannot carry, and shows exactly where the join to outcome data breaks.

Table 2. Headline measures, defensible subset, 31 cycles

Measure	Value
Defensible cycles	**31**
Cycle enrolments	**1,261**
Completions	**739**
Completion rate	**58.6%**
Participant-hours	**103,064**

Source: *data/tpw-collective-impact.csv*, defensible subset (31 cycles). Participant-hours = completions × course hours. Measured

Five findings

1. The state asks for less than the sector already collects.

Section 16 requires four things. The sheet supplies two of them; its other eleven fields are not among the four. The gap is not collection. It is credibility, analysis and a third party.

2. The state forbids self-evaluation for publication.

Section 15 bars grant recipients from evaluating their own programs for external publication and requires an independent research entity. Internal learning is untouched; the published outcome claim is what needs a third party. That sentence is a market definition, and TPW is on the right side of it.

3. The money is allocated by budget size, not by merit.

$19.4 million divided by total qualifying points. Points are 1, 2 or 3 according to organisational budget. A small CBO carries one third the weight of a large one before a single bonus point is awarded.

4. 103,064 hours is a floor, not a total.

Reported hours count completers only. Against the 182,984-hour ceiling the sheet credits 56.3% of the hours a full cohort would carry: up to 79,920 hours are unaccounted for under the sheet's own convention, and 522 starters did not finish.

5. The record has no key.

No participant identifier, no demographics, no outcome field. Seventeen defects are catalogued in this report. Fifteen close in the sheet; two need a schema change and a conversation with a member.

> "While we are driven by a sense of humanity, but we are grounded in data."
>
> Transformative Programming Works · public site, verbatim (sic)

The sentence is the brief. This report tests whether the data can carry the weight the sentence puts on it. At cycle level it can. At participant level it cannot yet.

What this report is not

It is not an evaluation. It contains no outcome measurement, no recidivism figure and no cost-effectiveness claim. The only modelled page is labelled as a model and rests entirely on published, unverified percentages.

What would change this report

A key. One participant token, salted, stored apart from the program row. Without it, the next report is this report.

A reader. An independent evaluator, contracted before the funding period closes. §15 requires one for anything published.

A clean set. 31 cycles, published with the six exclusions named. The number is only usable if it can be audited.

1. The ask in the state's words

CDCR asks for four fields. The sheet cannot supply two of them.

> **16. REPORTING REQUIREMENTS**
>
> Each grant recipient shall be required to submit annual reports, and a final summary is also required report detailing the expenditure of grant funds including a summary of how the resources of this grant funding enhanced their ability to deliver In-Prison programming.
>
> **a. Annual Report** — Each grant recipient shall submit an annual report to CDCR that details the expenditures of their grant, **to include the institution the funds were utilized, the number of participants, and populations served.**

RIGHT Grant 4.0 RFA · §16 Reporting Requirements, p. 11 · verbatim

Strip the prose and exactly four data points are required: **expenditure**, **institution**, **number of participants**, **populations served**. No outcome, no recidivism, no completion rate, no hours.

The Collective Impact sheet carries institution and participant count. It has no expenditure field at all, and no populations-served field — the closest proxy is knowing which two facilities are women's prisons. The state asks for less than TPW collects, and the sheet still misses half of it.

That is the first honest finding: before the sector can be asked for outcomes, its own reporting form has to clear the state's minimum.

Figure 1. What the state requires, and what the sheet captures

	RFA §16 REQUIRES	COLLECTIVE IMPACT SHEET HAS
Expenditures	●	○
Institution	●	●
Number of participants	●	●

● field present ◐ inferable only ○ absent

2 of 4 required fields are missing

Source: RIGHT Grant 4.0 RFA §16 (p. 11); *data/tpw-collective-impact.csv*, header row, 13 fields. A field is "present" only if it exists as a column; inference from free text does not count. Measured · Document

2. The money and the rules

$19.4 million, divided by points, decided by budget size.

> **4. FUNDING DESCRIPTION**
>
> This project will provide $19.4 million to support eligible community-based, nonprofit organizations for the purpose of delivering trauma-informed, rehabilitative and/or restorative justice programming in CDCR institutions.

RIGHT Grant 4.0 RFA · §4, p. 2 · verbatim

> **9. FUNDING**
>
> Eligible organizations shall be awarded grants based on qualifying points as specified within this section. **The total funding available shall be divided by the total points awarded to all eligible organizations, resulting in a dollar value for each point.** Each eligible organization will receive funding corresponding with the total points awarded.

RIGHT Grant 4.0 RFA · §9, pp. 4–5 · verbatim

Table 3. The allocation ladder

Points	Budget
1	Under $250,000
2	$250,000 to $500,000
3	Above $500,000
4	Maximum, with bonuses

Points are set by the organisation's current budget, or its average for the last two years, whichever is greater. Up to two half-points may be added for underserved institutions, for special populations (RHU, EOP/MHCB), and for programming in languages other than English — each applied once, capped at one extra point in total.

The only quantitative discriminator in the formula is the size of the organisation. There is no quality term.

> **Scenario arithmetic · not a forecast**
>
> If the applicant pool came to exactly **120 qualifying points** — say 120 organisations at one point each — a point would be worth **$161,667**. An organisation holding three points would draw **$485,000**; one holding four, $646,667. The real denominator is unknown until applications close on 30 November 2026. This is division, not prediction.

Key dates · §11 verbatim, plus the cover page and §16

10/01/2026	11/30/2026	02/26/2027	03/29/2027	04/30/2027	07/01/2027	12/01/2029	12/01/2030
Application period opens	Applications due, 11:59 p.m.	Tentative eligibility notice	Resubmission period closes	Final eligibility notice	Funding period begins	Funding period ends	Final report due

Filled markers are the five dates §11 states verbatim. The three hollow markers are **not** in §11: the funding period comes from the RFA cover page ("Funding Period: July 01, 2027 to December 01, 2029") and 12/01/2030 from the §16 report table. Two inconsistencies in that table are worth flagging to CDCR: Annual Report #3 is due 02/01/2029, before the reporting period it covers even begins on 07/01/2029; and the Final Report period opens 05/01/2027, two months before funding begins.

Eligibility is not the constraint

> The organization applying shall have a preexisting record of providing rehabilitative programming within a CDCR institution during at least two of the five years preceding their application.

RIGHT Grant 4.0 RFA · §6(b) Prior Service Requirements, p. 3 · verbatim

A 2024–2026 submission record satisfies that test. Eligibility is a low bar; the allocation formula is the binding constraint.

What the formula rewards, and what it ignores

Rewards: organisational size (1, 2 or 3 points), reach into an underserved institution (0.5), special populations (0.5), non-English programming (0.5). Ignores: completion rate, hours delivered, retention, curriculum quality, years of service. Four points is the ceiling.

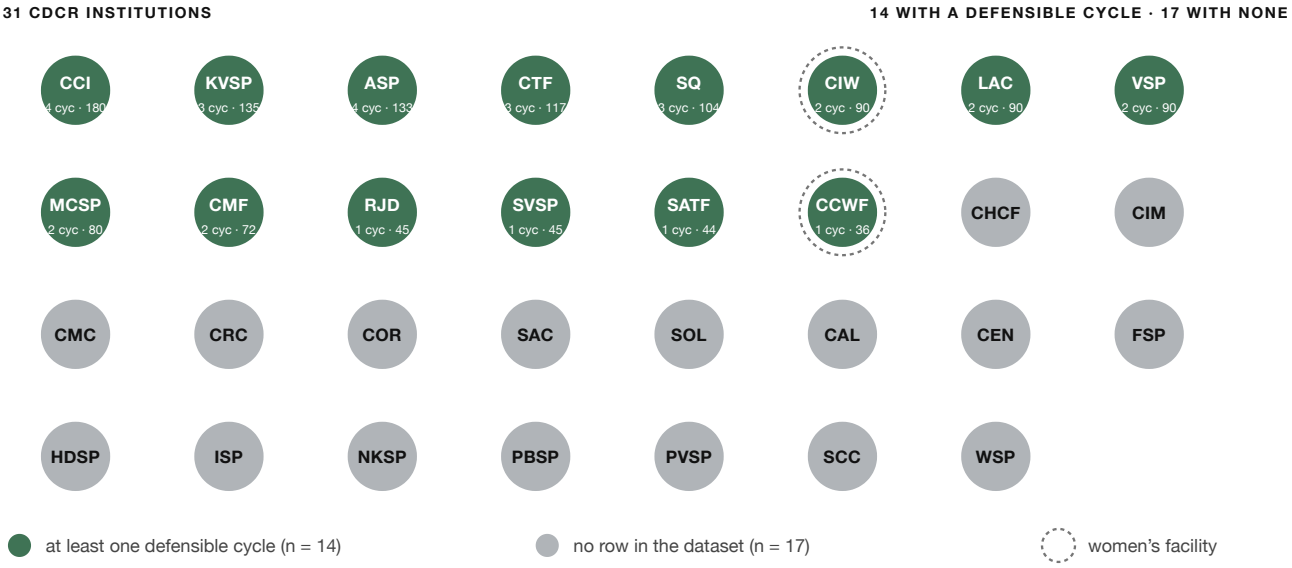

An organisation at 68.3% (San Quentin) and one at 32.2% (Valley State) reach the same point total if their budgets match. The formula is a size index with three equity adjustments, and the sector has not yet argued for a quality term.

3. Coverage

Fourteen of thirty-one institutions appear. Seventeen have no row at all.

The §9 footnote defines an underserved institution as one with "a lack of community-based programming services available." That is a coverage question, and coverage is the one thing this dataset can actually measure.

Figure 2. The 31 CDCR institutions, by presence in the dataset

Source: *data/intake/facilities.json* (31-facility constants tab) joined to *data/tpw-collective-impact.csv*, 31 defensible cycles. Cycle and participant counts are per facility, defensible subset only. Measured

14 of 31 is 45.2%

Fourteen institutions carry at least one defensible cycle. The other seventeen — CHCF, CIM, CMC, CRC, COR, SAC, SOL, CAL, CEN, FSP, HDSP, ISP, NKSP, PBSP, PVSP, SCC, WSP — have no row. In a catalogue of 31 prisons, that is not a rounding error; it is the map of where these two organisations are absent — the closest thing to a coverage map the sector has, and the reason a per-institution map has to be built.

What §9 would need

An application can claim the underserved-institution bonus once, worth half a point, for institutions that lack CBO programming. A verified coverage map is therefore directly worth funding — but only if coverage is computed per institution from submitted rows, not asserted.

The scale of the gap

Of the 127 member organisations named on TPW's own site, two appear in this dataset with real data, and a third appears only as the **SAMPLE DATA** row. The collective is far wider than its collective evidence.

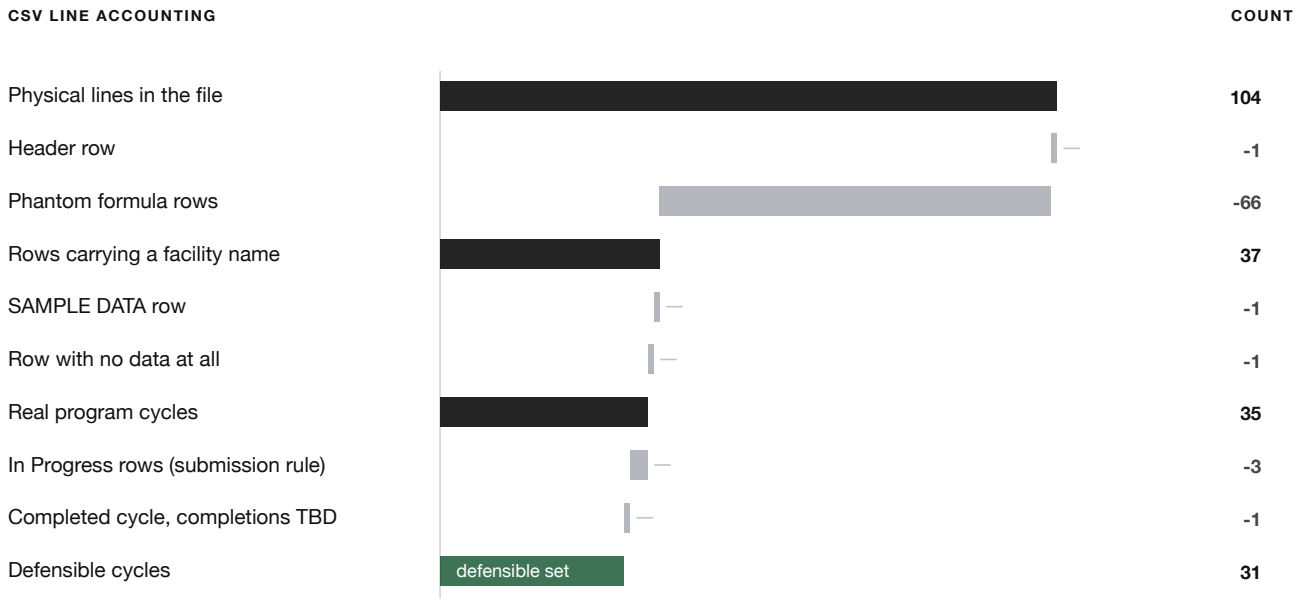

> **Published versus measured: the "1 of 31" claim**
>
> TPW publishes "Only 1 of 31 CA prisons is fully served today." The sheet shows 14 of 31 institutions with at least one completed cycle. Both can be true: "fully served" has no definition anywhere in the corpus, so the published claim cannot be tested with this data. Presence can be tested, and presence is 45.2%. The distance between those two numbers is the definition the sector has not yet written down — and writing it is a precondition for claiming the §9 underserved-institution bonus.

4. The instrument

One hundred and four lines. Thirty-one usable cycles.

The sheet is not one table. It is a submission form, a formula drag and a worked example sharing a single tab — and counting rows naively overstates the number of program cycles by a factor of 3.4.

Figure 3. From 104 physical lines to 31 defensible cycles

Grey = rows removed at this step. Counting rows naively overstates cycles by 3.4× (104 ÷ 31).

Source: *data/tpw-collective-impact.csv*. Phantom rows are lines whose only non-blank cell is a literal 0 in the calculated participant-hours column, a spreadsheet formula artifact. Measured

The column-letter trap

The glossary numbers the form A–N, fourteen columns, with **K = "Funded by RIGHT 2.0"**. The CSV drops column K, so it has thirteen columns and every letter after J shifts. In CSV letters, participant hours are **column K** and program year is **column L**; the glossary calls those columns L and M. Letters in this report are CSV letters unless stated.

The consequence is not clerical. **Funding provenance cannot be determined from this data at all**, so no RIGHT-funded cycle can be separated from a non-RIGHT cycle.

A naming problem that costs 45×

Column H is labelled "Total Programming hours." It does not mean total. It means the hours one participant accumulates by attending every session: 176 for CEO of Your New Life, 104 for Guiding Rage Into Power, with no variance anywhere in the file.

Read as a total, a 45-person cohort's 176-hour course becomes 7,920 hours: one label, two numbers 45× apart, and no way to tell from the cell which one is meant. The proposed rename — **Course Hours (per Participant)** — is pending review by Rick Olesek and Kim Moore. It is a label change, not a new system, and it removes the sector's easiest way to overstate itself.

> ### The eight fields the state never asked for
>
> Program name, schedule status, start and end dates, course hours, completions, program year and notes. Five of these are genuinely additive to §16: curriculum, hours, completions, duration and reporting year. The sheet is already richer than the obligation. What it lacks is not ambition; it is a key and a third party.

5. The measured core

What the sheet can actually support.

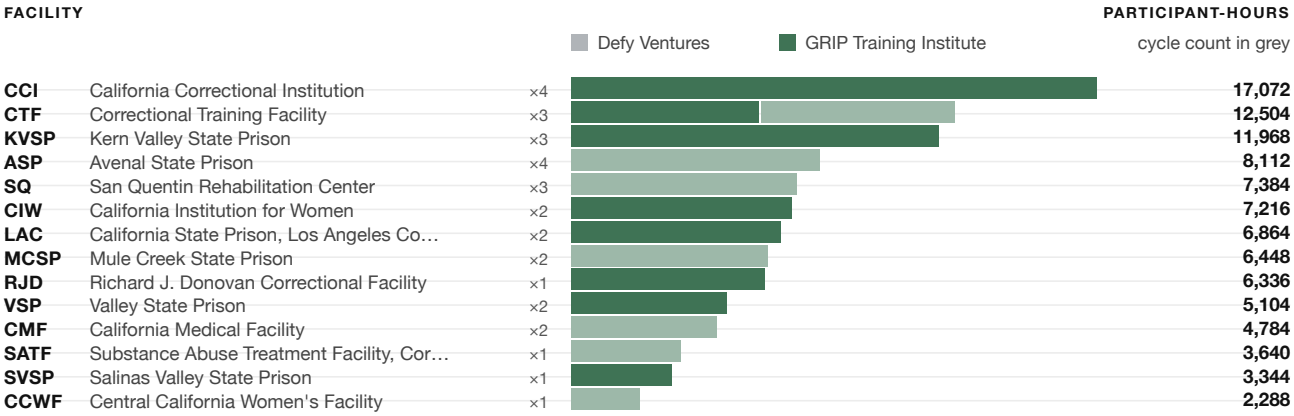

Every figure here excludes the sample row, the three in-progress rows, the unknown-completions row and the empty row. 1,261 counts enrolments, not people: without a participant identifier, two courses count one person twice. Defy's denominator is a constant 45 in all 20 of its rows, so its rates are throughput, not retention.

Table 4. Headline measures, defensible subset, 31 cycles

Measure	Value
Cycles	**31**
Cycle enrolments	**1,261**
Completions	**739**
Completion	**58.6%**
Participant-hours	**103,064**

SOURCE: *data/tpw-collective-impact.csv*, defensible subset (31 cycles). Participant-hours = completions × course hours. MEASURED

Figure 4. Participant-hours delivered by facility, split by organisation

Bars are participant-hours actually credited (completions × course hours). Ordered by hours, not by rate.

SOURCE: *data/tpw-collective-impact.csv*, defensible subset (31 cycles). Participant-hours = completions × course hours. Dark green marks Defy cycles, pale green marks GRIP; a two-colour bar hosts both. MEASURED

Table 5. Program year (by start date) · plus a de-duplicated, keep-largest sensitivity

Year	Cycles	Enrolments	Completions	Participant-hours	Rate
2024	17	661	386	51,880	58.4%
2025	14	600	353	51,184	58.8%
All cycles	**31**	**1,261**	**739**	**103,064**	**58.6%**
De-duplicated	27	1,134	656	94,432	57.8%

The shaded row collapses rows sharing one schedule: SQ ×3 (lines 25–27), Avenal B ×2 (30–31), CMF ×2 (34–35).

The shape of a cycle

Median duration is **321 days** (range 151–551), mean 355. A cycle carries **40.7** starters and **23.8** completions, and **139.5** participant-hours per completion.

Two curricula, no variance

CEO of Your New Life runs 176 hours (Defy); Guiding Rage Into Power runs 104 (GRIP). No other length appears, so there is no dose-response question here.

What is excluded here

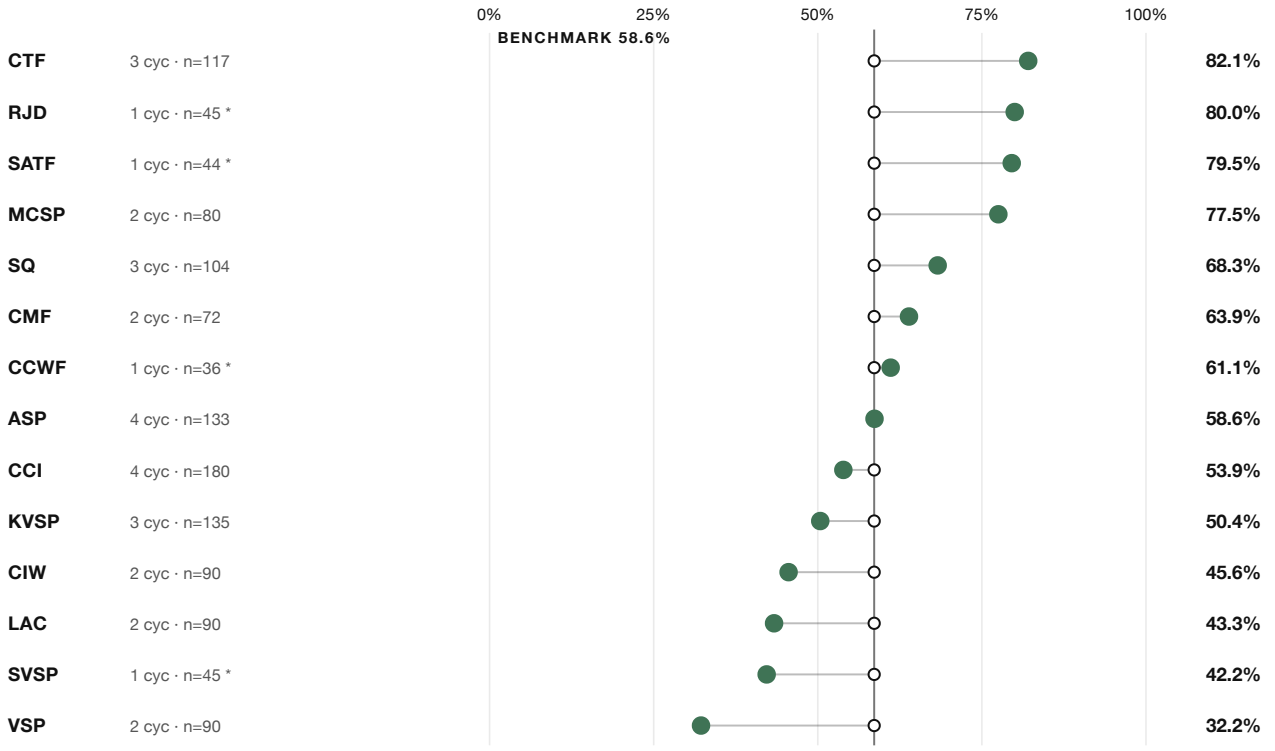

Six cycles and **208 starters**: the sample row (28), three in-progress rows (135), one TBD row (45), one empty row (0). 25 of the raw sheet's 764 completions are the sample's.

6. Completion

Completion by facility: 32% to 82%. At single-cycle facilities, it is a data point.

The pooled rate is 58.6%. The spread around it is wide enough to be interesting and thin enough to be dangerous: four of the fourteen facilities contributed exactly one cycle.

Figure 5. Completion rate by facility, against the pooled benchmark

* single cycle: a rate, not yet a pattern. The benchmark is the pooled rate for all 31 cycles.
Bars run from the facility rate to the benchmark; the hollow dot is the benchmark, the green dot the facility.

Source: *data/tpw-collective-impact.csv*, defensible subset (31 cycles). Rate = completions ÷ participants. Facilities ordered by rate. Single-cycle facilities are marked * and should not be read as performance. Measured

Defy 50.6% vs GRIP 69.3%

That comparison is confounded twice over: the courses are 176 and 104 hours, and removing four zero-completion rows lifts Defy from 40.4% to 50.6% by taking 180 starters out of its denominator. Defy's denominator is a constant 45 in every row: its rates are throughput, not retention.

What the exclusions were

Three **In Progress** rows and one **TBD**-completions row, each with 45 participants and no known completions. They separate the raw sheet's 52.0% from the defensible 58.6%.

A distinction that survives

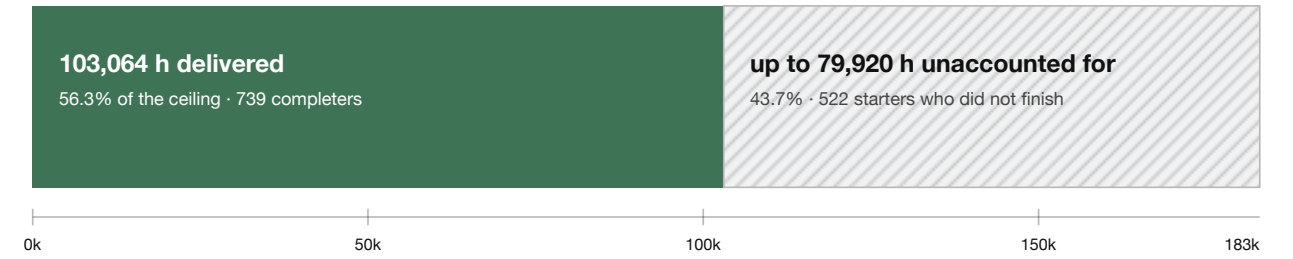

The year split is stable — 2024 at 58.4% and 2025 at 58.8% — and the facility spread survives the exclusion of every single-cycle site. Those two facts are the reportable ones.

7. The hours floor

103,064 hours is not the total. It is the floor.

The calculated column is completions multiplied by course hours. A participant who started and did not finish contributes zero hours to the sheet. The sheet therefore reports the hours that finished, not the hours that were delivered — and it cannot report the hours a non-completer did attend.

Figure 6. Participant-hours credited against the mathematical ceiling

HOW THE CEILING IS BUILT

Σ (participants × course hours) over the 31 defensible cycles = 182,984 h. Reported hours count completers only, because the calculated column is J × H.

Up to 79,920 h — the maximum shortfall the sheet's convention allows. Not a loss of funding, and not a measurement.

Source: *data/tpw-collective-impact.csv*, defensible subset. Credited = Σ(completions × course hours) = 103,064 h. Ceiling = Σ(participants × course hours) = 182,984 h. The gap is a bound, not a measurement: the calculated column credits a non-completer zero hours, so the true delivered total lies between 103,064 h and 182,984 h. Derived · Bound

Table 6. The hours floor, three ways

Measure	Value	Reading
The gap	79,920	participant-hours — the most that can be unaccounted for, 43.7% of the ceiling. Not necessarily undelivered: a non-completer is credited zero, and their real hours are invisible to this sheet.
The people	522	starters who did not complete, out of 1,261. Up to **79,920** hours of that difference is their uncredited programming, not lost funding.
Per completion	139.5	participant-hours credited for each of the 739 completions — a completions-weighted average of the two course lengths, not evidence about any one cohort.

> "They made me see that I am lovable and worthy of real love."
>
> Program participant · TPW public site, verbatim

The quote is the reason the hour matters and also the reason the hour is not enough. Nothing in this dataset connects a finished 104-hour cycle to what happened in the three years after release. That is page 13.

8. The ledger

Seventeen defects, each with a row and a fix.

D7 and D8 can still move a published total, so the measured core on p. 8 carries a de-duplicated sensitivity. Fourteen of the seventeen close in the spreadsheet; D16 and D17 do not. Most entries are also reasons not to publish the six excluded rows.

Table 7. Defect ledger · every entry verified against the CSV · where (CSV letters)

#	Severity	Defect	Where	Fix
D1	**Blocker**	**SAMPLE DATA row mixed into live data**	line 2, col M (Notes)	Delete before any publish
D2	Distortion	**TBD used as a completions value**	line 13, col J	Chase SVSP or exclude
D3	Distortion	**TBD across end date, hours, completions**	lines 17, 20, 21, cols G/J	Exclude until closed
D4	Distortion	**#VALUE! propagated by the formula**	lines 13, 17, 20, 21, col K	Guard formula against text
D5	**Blocker**	**Completed row with no dates, hours, participants or completions**	line 38, cols F–K	Delete, or return to GRIP
D6	Cosmetic	**510 days for a 104-hour course**	line 3, cols F/G	Verify the end date
D7	Distortion	**Three SQ rows sharing one schedule, blank yard**	lines 25–27, cols B/F/G	One row per yard
D8	Distortion	**Duplicate date clusters, blank yard**	lines 30/31, 34/35	De-duplicate with the org
D9	**Blocker**	**In Progress rows submitted anyway**	lines 17, 20, 21, col E	Enforce the status filter
D10	Distortion	**15 rows with a blank yard**	col B	Yard required where > 1
D11	Cosmetic	**Curly apostrophe in a facility name**	col A (CCWF)	Normalise before any join
D12	Distortion	**2026 end dates on completed cycles**	19 of 31 cycles	Flag 2025 as provisional
D13	**Blocker**	**No funding-provenance column**	absent from the CSV (glossary K)	Restore column K
D14	Cosmetic	**Header missing its closing paren**	line 1, col K	Reissue the header
D15	Distortion	**66 phantom rows**	lines 39–104	Clear the dragged formulas
D16	**Blocker**	**No participant ID, demographics, outcome**	whole schema	Add the join key
D17	Distortion	**Constant 45 participants on all 20 Defy rows**	col I	Confirm with Defy before publishing any Defy rate

Blockers prevent a publishable number; distortions move a figure if left in; cosmetics invite misreading but move no total. The ledger reconciles to the 104 physical lines: 66 phantoms, 1 sample, 1 empty, 3 in progress, 1 TBD, 31 defensible, 1 header.

Two matter more than the other fifteen: **D13** means no cycle can be tied to RIGHT money, and **D16** means no participant can be followed anywhere.

Fix order · the first four

D13 Restore column K
Without it, no cycle here can be attributed to RIGHT money or to anything else.

D16 Add the token
The join key is the entire point of the next phase, and it costs one column.

D1 Delete the sample
At 89.3% it is the second-highest rate in the file, and it is a worked example.

D9 Enforce the filter
Three in-progress rows should never have been submitted at all.

9. The gap

The form has no key. Without a key there is no join.

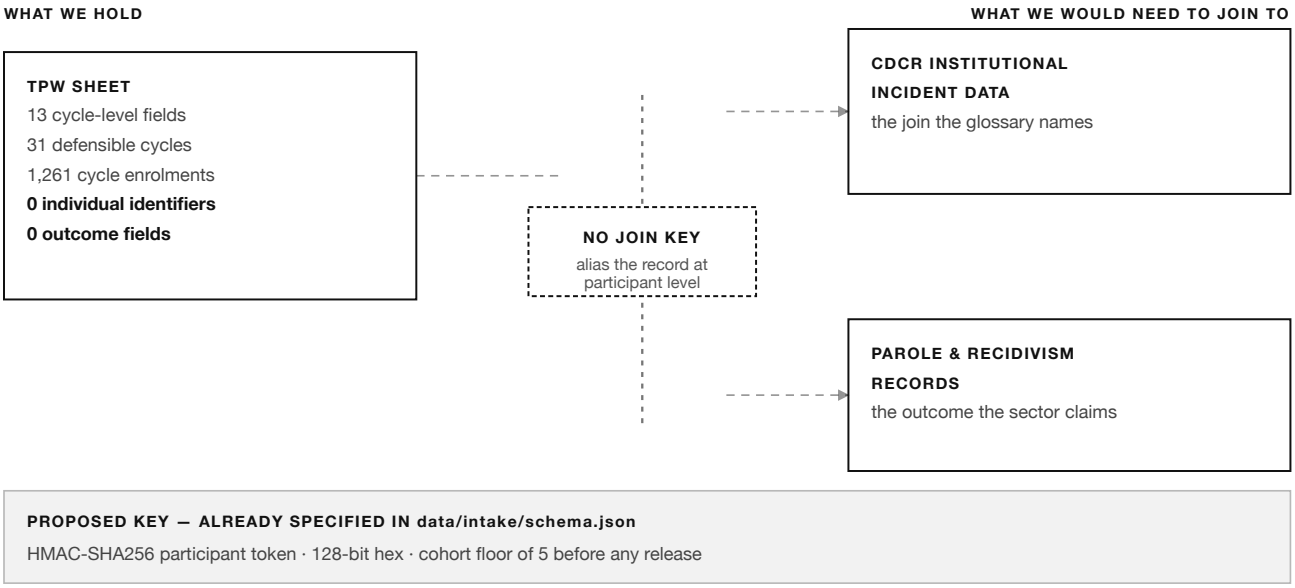

> **15. RESEARCH**
>
> Advance approval for research shall be obtained through the CDCR Office of Research's Research Oversight Committee process. **For external publication purposes, grant recipients are not permitted to evaluate any programs administered solely or in part by the grant recipient. Grant recipients shall obtain the services of an independent third-party research entity to ensure the use of independent rigorous systematic approach to gather, track, and report on efficacy, measure outcomes.**

RIGHT Grant 4.0 RFA · §15 Research, p. 11 · verbatim

Section 15 does two things at once. It forbids the grantee from *publishing* its own outcome evidence — the bar is on evaluation "for external publication purposes", not on internal learning — and it mandates the purchase of an independent one. For a collective whose member organisations are mostly too small to field an evaluation function, that is not a barrier. It is the case for a shared one.

The glossary is more modest than the sector's rhetoric. It says dates exist "to eventually correlate with facility incident data." The named future join is **institutional incidents**, not recidivism and not parole. That is a weaker outcome than the one TPW's public claims imply — and it is the honest one.

Figure 7. Why the records cannot be joined

Sources: *data/tpw-collective-impact.csv* (13 fields); *docs/TPW Data Glossary Instructions.docx*, start/end date note; *data/intake/schema.json* (proposed HMAC-SHA256 token). Measured · Schematic

The one field that unlocks everything

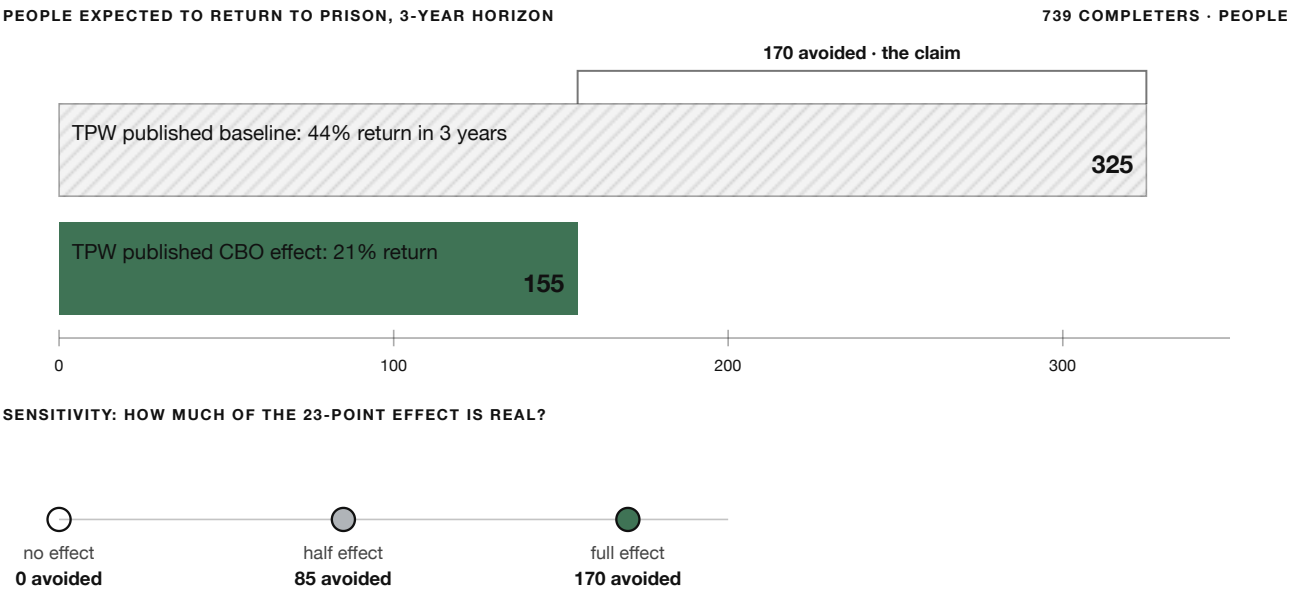

A 128-bit token, salting on submission, stored apart from the program row. It costs one column, breaks no privacy requirement, and converts every future cohort from an anecdote into a joinable record. Nothing else in this report matters as much, and nothing else is as cheap.

10. A model, not a finding

If TPW's published effect were true, it would look like this.

This page exists to show the shape of the claim, not to make it. It takes the 739 completions in the defensible set and applies two published percentages that cannot be verified from any file in this repository.

Figure 8. Modelled returns for 739 completers over three years

Sources: TPW public site, verbatim ("44% will be reincarcerated within 3 years of release"; "CBOs) reduce reincarceration to 21%" (sic — the stray parenthesis is in the source)). Neither rate is reproduced from CDCR data in this repository. Arithmetic: 739 × 0.44 = 325; 739 × 0.21 = 155; difference 170, rounded to whole people. Modelled

Assumptions, stated in full

1. The cohort is the 739 completions in the 31-cycle defensible set, and no one else.
2. The baseline is a 44% three-year return rate, taken from TPW's public claim. It carries no published denominator.
3. The program effect is a 21% return rate for CBO participants, likewise a public claim, likewise unverified here.
4. The full 23-point difference applies to these particular completers, with no selection effect, no difference between the two curricula, and no attrition after release.
5. Rounding is to whole people at each endpoint. No confidence interval is computable, because neither rate has a published sample.

What would turn this into a finding

Four things, in order: a participant key (§16 and schema.json); a matched comparison group of non-participants at the same institutions; CDCR Office of Research approval; and an independent evaluator, which §15 requires before anything is published. Until all four exist, 170 is a hypothesis with good typography.

The model is deliberately generous. It assumes the published effect is real, applies it in full, ignores the difference between a 104-hour and a 176-hour course, and asks nothing about who volunteered. If the true effect were half as large, the number would be **85**; if it were zero, **0**. Those are the only honest bounds the sector can currently offer.

Nothing on this page may be cited as TPW program evidence. It is arithmetic on a claim, and it is labelled as such in the figure, the caption, the tag and the heading.

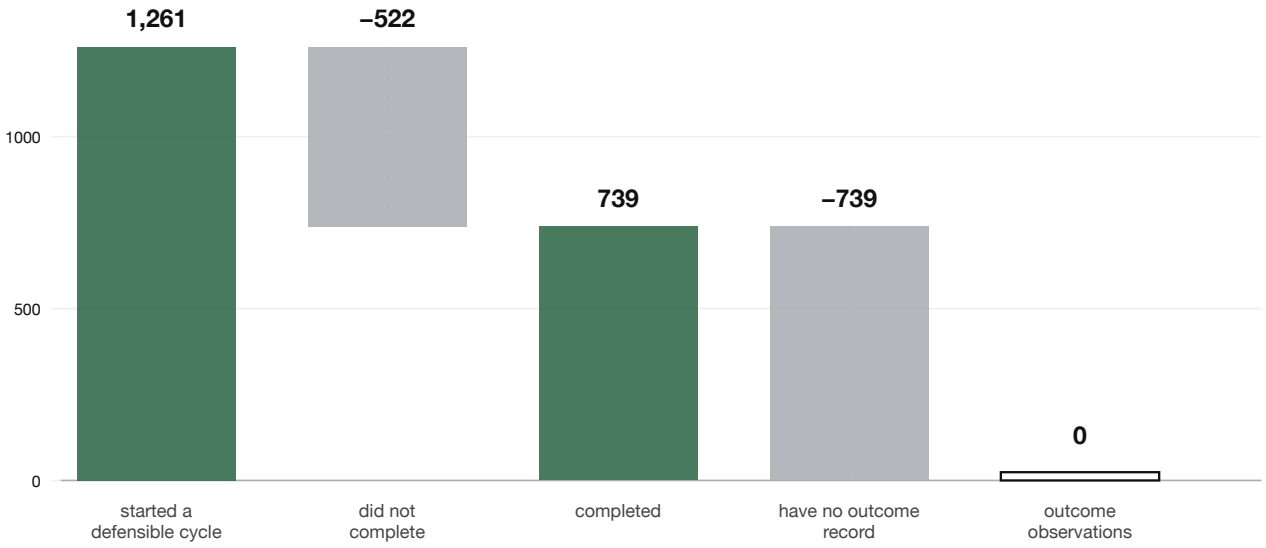

11. The evidence chain

From 1,261 starts to zero observed outcomes.

The chain does not narrow to zero because people stop participating. It narrows because the record cannot follow them past the cycle boundary.

Figure 9. The full chain, from start to observation

THE EVIDENCE CHAIN, END TO END

Every completion loses its identity at the cycle boundary. The chain does not narrow to zero because the people stop; it narrows because the record cannot follow them.

Source: *data/tpw-collective-impact.csv*, defensible subset. Starts and completions are measured. Outcome observations are zero because the schema contains no outcome field and no participant identifier — not because the outcomes were collected and found empty. Measured

01 One key

A per-participant token that survives release, stored apart from the program record and never printed on a roster. HMAC-SHA256, 128-bit hex, cohort floor of 5 before release.

02 One permission

Consent language wide enough to cover a research join, cleared with the CDCR Office of Research before the first cohort is enrolled — not after the first report is due.

03 One evaluator

An independent third-party research entity, as §15 requires for any external publication, working from the joined data rather than from a self-reported survey.

> **The clock is not neutral**
>
> The largest joinable cohort today is 739 completions, the most recent of which closed in June 2026. A three-year follow-up therefore lands in 2029 — inside the RIGHT 4.0 funding period, which ends 12/01/2029, but before the final report due 12/01/2030. A key issued this year produces one readout inside this grant. A key issued next year produces none.

12. Recommendations

Seven moves, in order. Four of them are free.

The sequence matters: the key has to exist before the evaluator can use it, and the evaluator has to be contracted before the funding period closes. 01, 03 and 04 can all be done in the spreadsheet this week.

01 Freeze the defensible set

Publish the 31 cycles with the six exclusions named, and regenerate the figure from the raw sheet so the number is auditable.

Measured · this week

02 Add the two missing §16 fields

Expenditures and populations served. Two columns close a state reporting gap the sheet currently cannot fill at all.

§16

03 Rename H, lock the calculated columns

Course Hours (per Participant) removes the 45× misreading; protecting CSV columns K and L, the calculated pair, keeps it removed.

Glossary §3.2

04 Enforce one row per yard

Three San Quentin rows share one date pair. One schedule must not become three cycles, and a blank yard must not hide it.

Glossary, submission rules

05 Issue the participant token

HMAC-SHA256, 128-bit hex, cohort floor 5. It is the join key, it is already specified, and it costs one column.

schema.json

06 Budget the independent evaluator

§15 forbids self-evaluation for publication. Put the third-party cost in this application, not in next year's budget.

§15

07 Publish the coverage map

14 of 31 institutions, computed per institution, is the §9 underserved-institution evidence the sector currently only asserts.

§9 footnote

An eighth move is not in the sheet: publish the exclusions alongside the totals. Every number in this report is defensible precisely because it can be audited back to a row that was removed and a reason that was written down.

Sequencing against §11

This week

01, 03 and 04 — all three are spreadsheet work: freeze the set, rename H, de-duplicate the yards.

Before 11/30/2026

02 and 07 — the two missing §16 fields and the coverage map both belong in the application itself.

Before 07/01/2027

05 and 06 — the token goes live with the first post-award cohort; the evaluator is contracted, not recruited.

13. Sources and colophon

The next number is not in this report. It is in a parole file and an incident log, attached to a person the sheet cannot name. The work between here and there is a key, a permission, and an independent reader.
